

Power BI Dashboard Interview Questions & Answers

Q: Tell me about your project.

Answer: Built a Diabetes Risk Intelligence Dashboard with Executive Overview, Risk Analysis, and Demographics & Lifestyle pages using Power BI, DAX, and a star schema.

Q: Why this project?

Answer: To convert patient data into actionable healthcare insights.

Q: Business problem?

Answer: Identify prevalence, high-risk patients, demographic and lifestyle trends.

Q: Explain the data model.

Answer: Star schema with one fact table and supporting dimension tables.

Q: Why Star Schema?

Answer: Better performance and simpler reporting.

Q: Key DAX measures?

Answer: Total Patients, Diabetes Patients, Diabetes %, High Risk, Average BMI, Average Glucose, Risk Rates, Dynamic Insights, Last Refreshed.

Q: Why DIVIDE()?

Answer: Prevents divide-by-zero errors.

Q: High Risk logic?

Answer: Glucose >180 and BMI >30.

Q: Why three pages?

Answer: Separate executive KPIs, risk analysis, and demographics.

Q: Why KPI cards?

Answer: Instant visibility of key metrics.

Q: Why donut charts?

Answer: To show proportions.

Q: Why scatter plot?

Answer: To analyze BMI vs Glucose.

Q: Key findings?

Answer: 49.56% prevalence, 223 high-risk patients, Female 51.49%, Urban 59.58%.

Q: Recommendations?

Answer: Target high-risk screening, BMI management, urban awareness.

Q: Dataset size?

Answer: 10,000 patients.

Q: Difference between CALCULATE and FILTER?

Answer: CALCULATE changes filter context; FILTER returns a filtered table.

Q: Filter vs Row Context?

Answer: Row context evaluates each row; filter context comes from visuals/slicers.

Q: Why should we hire you?

Answer: I can build end-to-end Power BI solutions with strong DAX, modeling, and storytelling.
